---

Our range of activities extends from individual test stand development to the development and qualification of critical processes and prototype construction. Many years of experience in the development of medical devices and the wide range of specialist disciplines available at evos provide the perfect basis for developing innovative technical solutions.

Depending on the customer's requirements, we present fast, creative solutions or can apply QM-compliant procedures that come into play especially for validation tasks. We quickly implement the mechanical, electrical, and hydraulic design of components in our in-house laboratories. Thanks to our internal measurement and production capacities, we carry out feasibility studies within the shortest possible time and produce samples according to the required product maturity level on request.
